## Water Quality Targets

## **Set of Targets**

Target for each of the impaired waters

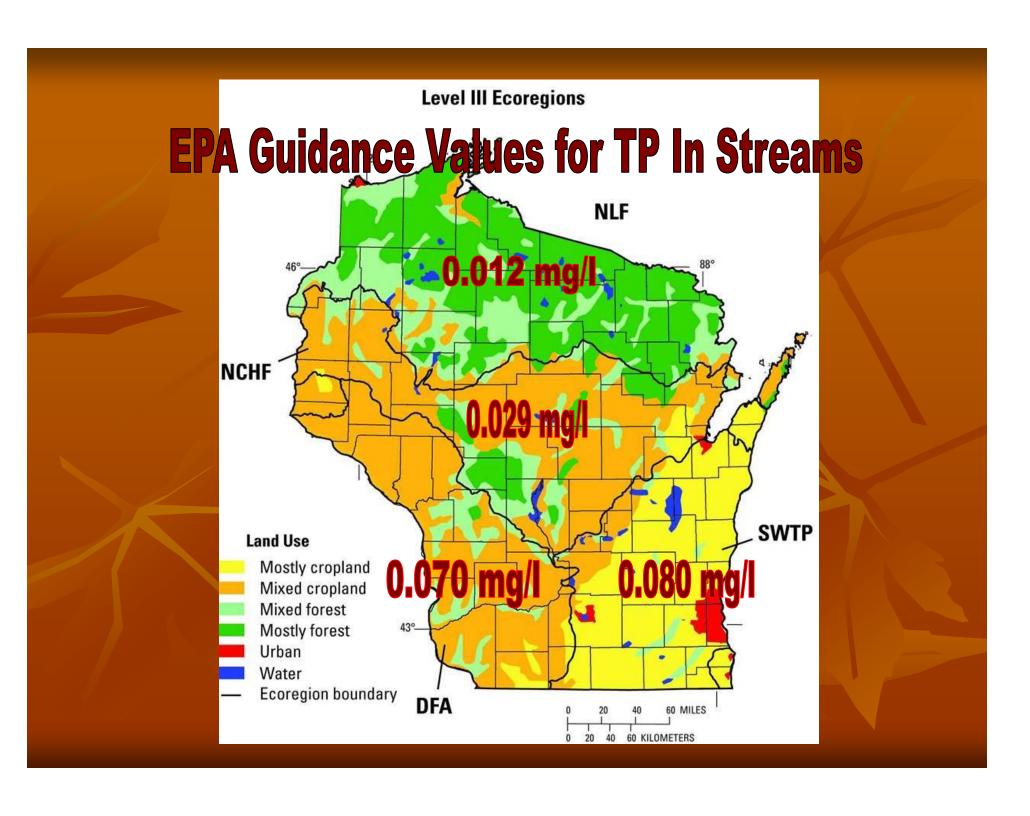

■ Target may vary — do not need to use the same target of each of the waters

# When using narrative criteria in TMDL development ...

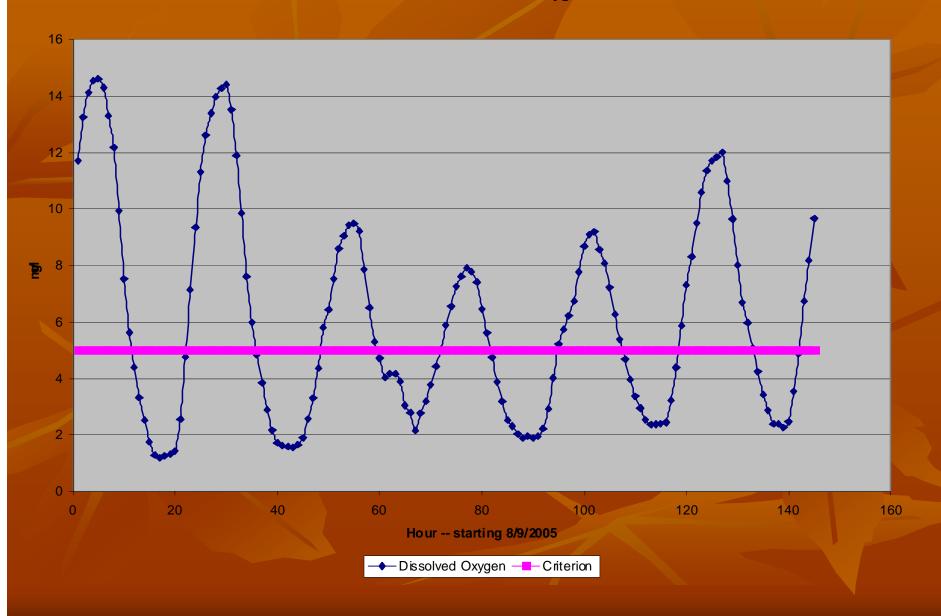

State must assign numeric values

## Methods of assigning numeric values

- EPA Sub-ecoregion guidance values
- Relationship to other water quality parameters
- Comparison to similar waters
- Reference conditions
- Effects based most highly related factors

#### **Breakpoints / Thresholds for Biological Response**

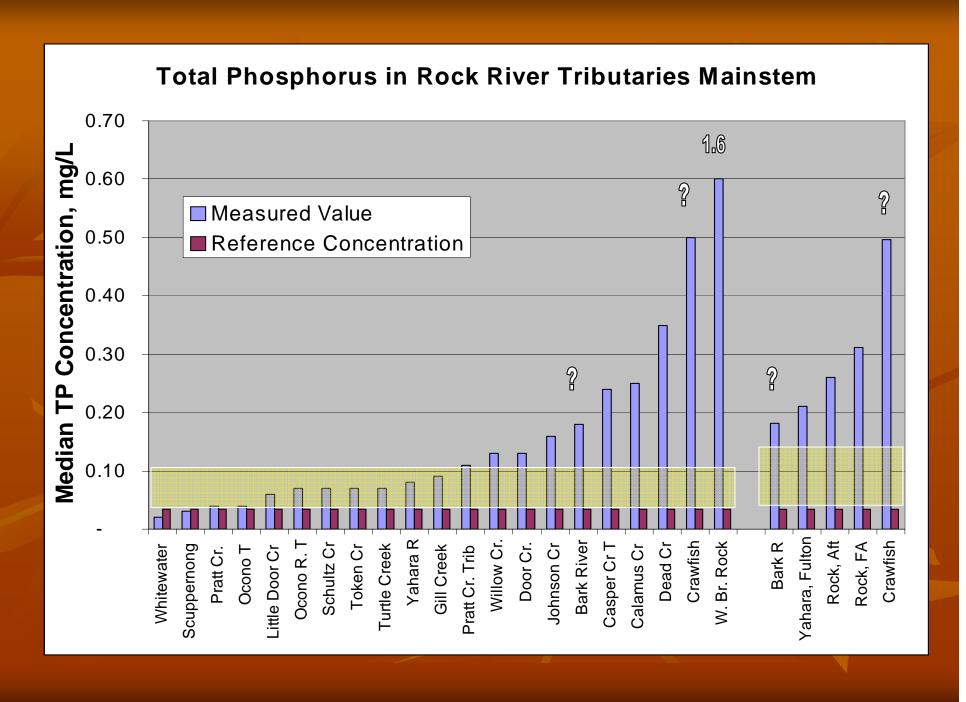

Thresholds or break points in the response in water quality and various biological indices to changes in Phosphorus concentrations (in mg/L)

| Biological Indices             | Total Phosphorus |                     |
|--------------------------------|------------------|---------------------|
| Water Qua                      | ality            |                     |
| Secchi Depth                   | 0.106            |                     |
| Suspended Chlorophyll          | 0.070            |                     |
| Benthic Chlorophyll            | and Diatoms      | Range               |
| Benthic Chlorophyll            | 0.039            | 0.039 – 0.106 mg/L  |
| Nutrient Index                 | 0.057            | 0.037 = 0.100 Hig/L |
| Siltation Index                | 0.074            |                     |
| Biotic Index                   | 0.072            |                     |
| Macroinverte                   | brates           |                     |
| Hilsenhoff Biotic Index        | 0.088            |                     |
| Percent EPT individuals        | 0.087            |                     |
| Percent EPT taxa               | 0.091            |                     |
| Fish                           |                  |                     |
| Fish Index of Biotic Integrity | 0.055            |                     |
| Percent carnivorous fish       | 0.055            |                     |
| Percent intolerant fish        | 0.067            |                     |

#### **Breakpoints / Thresholds for Biological Response**

Thresholds or break points in the responses in water quality and various biological indices to changes in Total Phosphorus concentrations for nonwadeable streams in Wisconsin

|  | Total      |                    |
|--|------------|--------------------|
| Biological Indices                                   | Phosphorus |                    |
| Water Quality  |            |                    |
| Secchi Depth   | 0.091      |                    |
| Suspended Chl Log                                    | 0.064      |                    |
| Macroinvertebrates                                   |            |                    |
| Species richness                                     | 0.150      |                    |
| Mean pollution tolerance index                       | 0.064      |                    |
| Percent of individuals from order Ephemeroptera      | 0.040      |                    |
| Hilsenhoff biotic index                              | 0.150      | Range              |
| Percent of individuals from order Plecoptera         | 0.148      | 0.04 – 0.15 mg/L   |
| Percent of individuals that are scrapers             | 0.034      | 0.04 = 0.15  Hig/L |
| Fish   |            |                    |
| Wisconsin large river index of biotic integrity      | 0.139      |                    |
| Percent of Weight that is Suckers                    | 0.091      |                    |
| Number of Intolerant Species                         | 0.139      |                    |
| Percent of individuals that are river species        | 0.079      |                    |
| Number of River Species                              | 0.147      |                    |
| Percent of individuals that are lithophilic spawners | 0.055      |                    |

### **Method Used**

- Non-wadeable
  - For each subcategory Water Chemistry, Benthic algae, Macroinvertebrates and Fish:
    - Spearman Rank weighted average for breakpoints
    - Average of weighted averages
- Wadeable
  - Similar, but limited to top two correlations for fish and macroinvertebrates
  - Will need to add water chemistry in future

## Results for Total Phosphorus

■ Wadeable = 0.08 mg/l

■ Non-wadeable = 0.125 mg/l
